

ADVANCED CAR WASHING SYSTEM

EUROS

The ELCE water activator is ready to be installed.
The efficiency is proved by numerous actual results.

ELCE activated water

- The special ceramics are made of pure water. Natural stones are crushed in powder and fused at 1,600°C. Finally, non-porous granules of 2 mm diameter are produced.
- The column is made of thousands of particles in a constant state. The water molecules are pulverized, the water permeability is increased. The foaming activity of the activated water is much more high as compared to that of normal water. Moreover, the activated water enhances the washing effect of detergents.
- A weak electric charge, produced by colliding ceramics granules, is imparted to the water and the water becomes ionized.
- The activator for car washing system is developed in cooperation with Nihon Jisui Co. Ltd.
- The application of the activated water:
 - Desodorizing and removing of gas from boiler tanks and pipes in the power plants, chemical plants.
 - Descaling.
 - Preventing of scale and rust formation in boilers and water reservoirs (tanks).
- *The water activator developed by Nihon Jisui is acknowledged by The Japan Water Supply Company.
